

THE VIEW AT END OF Q3 2026

Run GenAI like the regulated system it is

Most enterprise GenAI diagrams are shelves of product logos. By the end of Q3 2026, almost half of the tiles on the most widely shared stack diagram needed a correction: acquired, renamed, mispositioned or superseded.

This book takes a different route. It asks what a regulated asset manager actually needs to run GenAI safely in production, and answers with a reference architecture: nine layers, from foundation models to evaluation, under a firm-owned control plane of eight components (gateway, guardrails, privacy, identity, configuration, FinOps, security and model risk).

Every layer and control gets its own chapter: how it works, design principles, selection criteria, product deep dives, a decision tree, lock-in classification, the regulated financial-services lens and a worked example. 140 products are assessed on one rubric, every claim is labelled and every fact traces to a dated source.

- A reference architecture for regulated firms, layer by layer (L1 to L9) and control by control (C1 to C8)
- 140 products assessed on one rubric, with Strategic, Tactical and Experimental tiers and their conditions
- Four reference stacks, a build-versus-buy view, lock-in by layer and an 18-month roadmap
- EU AI Act, DORA, the UK critical third-party regime and model-risk rules applied to GenAI
- One worked example throughout: an agent drafting a fund's monthly attribution commentary
