

Earn trust in the pull request

	THE BUYER'S STACK EXPECTS	THE CODING AGENT MUST
L1 Models	The customer's chosen vendor and tier, pinned	Keep prompts and tools model-agnostic; qualify per task type
L2 Inference	The customer's endpoint or private route	Use a configurable client; tolerate throttling in background work
L3 Orchestration	Plan, change, test, pull request	Run durable tasks with a step budget; stop on request
L4 Tools	Tools behind the customer's tool gateway	Use allow-listed tools; run code only in a sandbox, egress denied
L5 Memory	Nothing held by the vendor	Propose learnings as pull requests to repository guidance
L6 Stores	The repository is the store	Build a per-task index; destroy it at task end
L7 Retrieval opt.	The customer's embedding service, if any	Use pinned, self-hostable embeddings
L8 Ingestion	Approved sources only	Read only what the task names; treat repository text as data
L9 Evaluation	Spans to the customer's collector	Emit agent and tool spans, pinned version, content off
C1 Gateway	Gateway-routed calls, a key per task type	Take a configurable base address; no direct vendor path
C2 Guardrails	The customer's tests, linters and code scanning	Treat the customer's CI result as the gate
C3 Privacy	The customer's privacy service	Redact personal data and secrets before any export
C4 Identity	Sign-on and provisioning; the agent acts for the engineer	Register as an agent; short-lived tokens scoped to one repository
C5 Configuration	Configuration as code in its source control	Keep policy, routes and tools in one versioned file
C6 FinOps	Cost per customer, team and task	Export tokens, cache hits and runner minutes per task
C7 Security	The customer's vault and package mirror	Resolve from the mirror only; a component list per release
C8 Governance	An evidence record per agent action	Write task, model, tools, commands, diff and approver to its store

THE BOUNDARY: THE PULL REQUEST

agent branch → customer CI and scanning → a named human merges

commit trailers name the agent, the task and the directing engineer; the agent's identity can never satisfy a required review

NEVER
merge, push to a protected branch, hold a standing credential, or keep the code
