

Every retrieved document is untrusted input

WORKED EXAMPLE · AN INJECTED MARKET NOTE MEETS SIX LAYERS

THE FIRST RULE NEEDS NO PRODUCT
Remove any one of the three
and an injected instruction has nowhere to go. Buy detection last.

THE SIGNAL
Agents combining all three
target zero, unless a documented exception has a named owner

No agent should hold untrusted input, sensitive data and an outbound channel at once. Around that rule, six layers defend the worked example so that no single detector has to be right. Generic: no vendor names.
