

Self-hosting is a capacity decision, not just cost

CONTROL PLANE

The gateway (C1)

routing · fallback · budgets · policy · request log

↑ lifted out of L2: every call goes through it

L2 IS THREE JOBS

3 · MODEL ACCESS

Managed services, in an approved region

the default for regulated workloads, through the cloud estate you already run

2 · OPTIMISATION

Fleet orchestration

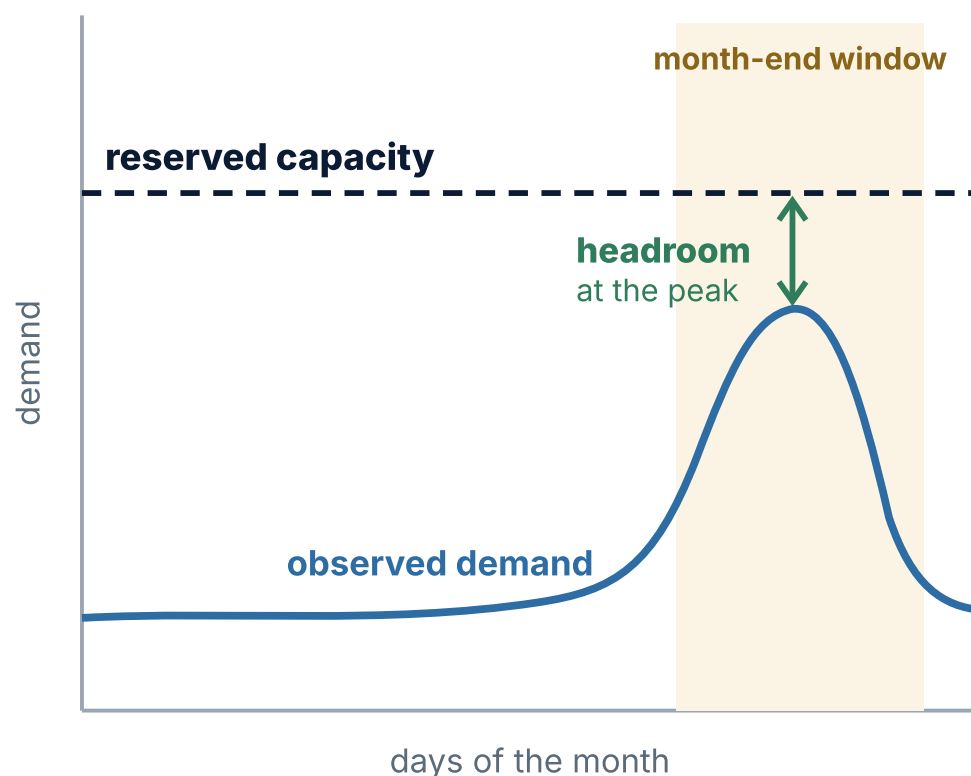

only if you run GPU fleets

1 · SERVING ENGINES

Run the model

patched monthly, on-call, re-qualified on every engine or quantisation change

MONTH-END DEMAND · ILLUSTRATIVE

Overflow stays in region

→ pinned in region, never spilling silently to a global endpoint

THE SIGNAL

Capacity headroom at peak

reserved throughput minus observed demand in the month-end window; positive, with a margin, before go-live

ONE CAPACITY PLAN

Write four things down

the peak

reserved amount

overflow behaviour

degraded mode
