

Most enterprise "agents" should be workflows

THE WORKED EXAMPLE AS A GRAPH, NOT A LOOP

L3 · THREE CONCERNS

1 · DEFAULT
Deterministic workflow orchestration
graph, state, approvals

2 · ADMITTED PER USE CASE
Bounded agent steps
declared autonomy budget, tool allow-list, sandbox

3 · BENEATH BOTH
Durable execution
reliability substrate and managed runtime

L3 MUST NEVER

- release without a recorded human approval
- re-call the attribution engine on resume
- let the model add tools at run time

THE SIGNAL
Path conformance: 100%
runs whose executed steps match the approved graph; any deviation is a defect

Autonomy is a budget: declared, approved and owned per use case
Often the right number is zero or one.

The worked example's commentary graph: a pinned sequence of steps with one bounded drafting step, a hard evaluation gate and a human approval interrupt, on a durable checkpoint store. Generic: no vendor names.
